

INQUIRY INTO DINGOES IN NATIONAL PARKS IN NEW SOUTH WALES

Name: Noeline Franklin

Date Received: 22 July 2026

Introduction

This inquiry was established on 19 May 2026 to inquire into and report on dingoes in national parks in New South Wales.

Please note the closing time for submissions has been updated to Tuesday 21 July 2026 at 11:59pm.

If you are experiencing technical difficulties with the portal, please refresh your browser, otherwise submissions can be received directly to Animal.Welfare@parliament.nsw.gov.au.

Animal.Welfare@parliament.nsw.gov.au.

Noeline Franklin landholder NSW

where our sheep goats cattle horses donkey have restored the big animal mob activities native plants and animals thrive, seek big animal activity to enhance water sharing, fire safe ecologies. Biodiversity centres invariably have a long history of grazing, forestry, cool burning, dog removal. Currently national park declaration is a key threatening process for plants animals soils forests..... I am prepared to address the committee on the landscape ecological view of animal cruelty associated with dogs any DNA in SE Australia. The abundance removal and mysterious reappearance of these dogs.

This submission is intended to give an over view of dingo wild dog dumped in Australia over the last 3500+ years variously to be ratio dogs for Aboriginal. These dogs have never met the criteria for domestication in Australia or Asia were dog is still sort after as a culinary delight. As for the top order predator mumbo jumbo these dogs either credentialed Frazer Island wallaby killers stalking children or visiting adults or mysterious highly mobile central dog, pound dog hybrids from an experimental farm are all damaging to the native wildlife of far greater antiquity. For the last 65000 years or more Aboriginal people of any migration wave are the 'biodiversity regulators' estimated to have eaten, burnt dispossessed in the order of 63 specie of 532 specie in the last 65000 years. Since European arrival at least 34 mammals have gone extinct and dogs declared the "main culprit" aided and abetted by the arrival of rabbits pigs foxes cats all enjoying each others success. The winding back of Aboriginal hunting eating dogs and cats 1788-1930s+ has allowed

dogs to Hoover up wildlife extensively. It is naïve to declare biodiversity centres national park then let dogs have open slather then blame sun spots or climate change for the consequences.

Our community has been familiar with wild dogs now since the 1830s at least. This issue cannot be looked at in isolation of the greater ecology and surrounding dysfunction. We have been part of recovering wildlife populations by adopting Aboriginal management dog removal, cool fire and combined with restoring the imperatives of big animal migratory mobs since then and are appalled at the adoption by the water industry basically to bring back dogs to enforce, weaponise their 'no graze policies' in destocked dehabited man made wilderness in anticipation of saving costs on sale water treatment to remove traces of soot, silt, animal or human waste as assumed by-products of proven effective land management to secure **biodiverse habitat, fire safe, water sharing** to retain the well spaced forest. Experts of variable urban or foreign background have no idea what they do as fire suppressed dog country repeatedly burns to bedrock. Climate changed from vast dead forest and emissions trading manipulations unconscionable. Seed, soil building gone in the man made inferno neglect and negligence. Wildlife recovery squandered, starved butchered burnt. Dead forests do not deliver either water or our biodiversity conservation. Our watersheds head for permanent desertification.

Self appointed experts are politically connected, belligerent and will not be warned of the consequences of killer dog no graze driving demise well in progress, while making a bad situation catastrophic by aspiring to industrial strength fire suppression, no smoke except their own over city's bubbles of Canberra, Sydney, Newcastle, Wollongong, Melbourne, regulation no burn Adelaide to Cook Town, undermining of selective log salvage forest thinning, smoke free grazing options outlawed to transfer grazing forest emissions to urban consumerist activities of expanding electricity, transport, building cement steel aluminium mansions, with imported gadgets exotic food, plastic clothes fast fashion landfill, fast cars, boats caravans..... Globe trotting lifestyles retained by the manipulative bushwalking bunyip aristocracy. Confiscating dairy and timber coops for park visitors centres to tell tourists of what Australia used to do as renewable enterprise with effective environmental, economic, social outcomes.

National park wilderness city water catchment is a new invention over laying mainland Australia with land grabs used as collateral to entice basically city votes for its early days during the second world war when the stay at home pounced while others had their backs turned to maintain freedoms, human rights, democratic processes (freedom of the press) through campaigns in middle east, Europe, Asia Pacific variously. Aspects of Australian society basically being denied rural minorities knowing the imperatives of mixed specie grazing, applying strategic detoxifying cool fire and selective thinning of aggressive flammable monocultures to feed and encourage biodiversity, stable ground

cover to deliver quality reliable water supply. Fertile soils to support the natural and built ecologies.

Family and friends fleeing early industrial Britain when there was unemployment, illiteracy, famine, poverty, disease, no parliamentary representation or financial safety net. A lot of abuses, dispossession. Our families friends community cooperated integrated supported each other to survive the circumstances we were given from 1788. Circumstances largely not our making. We were colour and class blind. Shared what little we had to survive. Worked hard to improve our lot. The lot of Australia. The good people are not to be rolled into the bundle of those few not capable of sharing or caring. I and many others refuse to apologise for things we stood against then and now. Rehashing sorrow, difficulty, division, dispossession, gender biases, religious differences is generally not productive or progressive.

Aboriginal people like us have been under siege from wild dog anarchy for decades hundreds of years. Aboriginal management has long been integrated among our multicultural stockmen foresters fishermen. A matter perhaps missed by lobbyists using race gender occupation religion, where you live, the animals shape of feet you associate with as disruptive influences to get work done.

If you live in town you have support of rangers, pound keepers, registration, licences, police shooting dangerous dogs to protect family, postmen, neighbours and property pets vulnerable people and animals. Savage dogs can be habituated or completely feral unpredictable. Quiet apparently placid dogs, animated killers within seconds. One dog formidable, a pack of 19-26+ deadly. Carrying a rotten stick for protection totally naïve. People walking, or riding a horse are kidding themselves to think they are safe in dog country. People disappear because dogs (pigs foxes) hunting together leave nothing. Not even bones in most cases. Dogs devour echidna leaving only the quills perhaps in scats. Wildlife and sheep goats deer calves foals adult cattle horses. Muchless smaller quarry sheep goats kangaroo wallaby wombats are massacred their blood sucked hair wool scattered eaten leaving little trace but a bloody stool and disturbed ground gone after the first rain or wind blown leaves. Missing, disappearances are what our rural dog affected communities face. Our family over due, leads to frantic searches no one understands unless you experience it, once, twice, continually.

Has anyone on this committee experienced the feeling of looking for missing pets children people farm animals. Gaining pleasure from seeing possum wallaby lyrebirds ducks wrens.....in your paddock seeking the company and activity of your sheep goats cattle horses..... then to find a murder scene of a wallaby struggling for its life pulled inside out in a confronting bloody mess with dingo tracks all around. Echidna once recovered to common, disappeared turned to quills in wild dog dung mixed with wombat possum fur wool. People sitting harbour side can looking through glass, sit in judgement of rural families as “*persecutors*” trying to protect their public land,

generations of wildlife recovery, generations of breeding sheep cattle goats horses working dogs trying to secure the nations food water clothing housing employment deal with complacency and ignorance within opinionated disconnected uninformed academia media government bureaucracy recruited lobbyists.... Impenetrable fanaticism. Repeated warnings and pleas ignored dismissed conveniently as “uninformed uneducated.” Branded red neck vested interest even. Apparently rural communities denied vested interest to be legitimate. Generations of commitment and work confiscated for the sake of a false narrative. Media saturation.

Our communities raising children to understand humanity empathy to have a programmed indoctrinated school teacher, university academic, bureaucrat refute rural people are conservation minded, accused painted to “**unjustly persecute**” packs of killer dangerous dogs bringing havoc in the country when no one in town would tolerate an inkling of such threat, trauma! How dare they. Barbarism first order and a sciolous manipulation to undermine security of food water biodiversity public safety. Abuse of public office privileged positions of trust.

If this committee is looking at humanity, animal rights, landscape animal cruelty then the terms of reference are at risk of attracting more spin and deception that has apparently not been dealt with in decades.

1a) Wild dogs have variable DNA either derived in Australia or mix of Asian European wolf whatever they are. Drawing the line in a canid DNA continuum controversial in the least. Sensationalised for international groups preserving global dogs or canines. Does it matter if you have savage roaming dogs reeking damage? DNA is academic curiosity busy work to distract budgets and look to an endless line up of conferences in far off places. Intent on trying to legitimise the unjustifiable and attract some obscure public sympathy among an unaffected audience.

We have **no confidence** any more in the manipulation editing of what is put in the public domain as ‘**science**’ which has long lost its credibility, impartiality in Australia particularly “**hired for purpose agenda**” political spin of attracting revved up voting blocks wanting elite access to land, water, tourist destination, create food shortages, manipulate markets supply and so on. **Science the unbiased adjudicator is long gone.** Ruined reputation a long time ago. The science or the institutions conducting the hired research. 20+/41+ universities in Australia having failed audits of self governance on finance recently with morality concerns about scientific ethics given peer review student to professor, transient academic staff around the institutions. Hired ‘science’ you fund the answers you look for. Little to do with striving to provide objective reliable information to make good decisions on ecological good, truth, honesty, furnish an egalitarian society. Animal or human.

Wild dogs that are being bred, released under the pest control fences built in 1914 protecting SE Australia, 1927 western Australia. Management strategies frustrated obstructed undermined by regulators, lobby groups imposing their opinions and blind beliefs. Dogs sourced who knows where from pound dog hybrids crossed with desert dogs here and there, Frazer dogs eating tourists, translocated dumped to undermine enormous effort to achieve dog free, dog managed areas. About 13000km fence built maintained by the public and a lot of other 1000s of km private fences used as control lines for rabbits (1860+), foxes (1870+) fashion fur industry trinkets at unacceptable ecological economic social cost to Australia, pigs (1850s+) cats (300+y) dogs (3500+y). Massive effort put in by few people (4.4M in 1911) to fence remove rabbits pigs cats foxes dogs from destroying soil seed forests grass and shrub lands sediment streams, blow and wash away meters of soil. Starve animals people. Destroy vegetation of any ethnic origin or worth. The fashion set in Europe America cared little reaping fur meat feathers leathers, specie extinction, any cost to Australia Africa Americas.... Australians today 90% living in urban landscapes and 30+% not born here and few integrated in 1-2 generations on matters of rural affairs historical fact, knowingly misled by various institutions and media parroting spin and agenda loaded mythinformation . Mythinformation either mischievously erroneous or ill informed 6 year old reader standard.

In early settlement through to today, Aboriginal were provided white mans flour meat (fruit vegetables if any available to any of us). Wildlife decimated by their hunting dogs rendered unmanaged were relieved of Aboriginal hunting 1788-1930+ to hopefully survive the chaos of rabbit plague where dingo populations were buoyed beyond anything previously possible, neither suppressed by human hunting for milk fed pups or adult dogs hunted around water holes where they lurked to ambush people or wildlife. Today stalk fishermen beach inland stream lake..... Like the Asian fishermen bringing dingo to Australia as gifts, or ration dogs jumping ship, Aboriginal had dogs, later cats as dinner guests. This gave wildlife of greater antiquity a competitive, survival chance in vegetation carefully managed with proactive astute fire regimes since the native mega fauna hunted to oblivion about 50000y ago 10000-15000+ years after Aboriginal arrival as Homo erectus, Homo sapien Devonian all of the above as a non homogenous or discrete migration. Variously displacing each other and or interbreeding. Then and since 1788. What is dingo or indigenous? Does DNA matter for dogs, foxes, rabbits, people or pigs? More ***distractive semantics*** to disrupt dog management. Is dingo more valuable than quokka, bettong, bandicoot, antechinus, wallaby, stick nest rats, echidna platypus.....? What of the validity of claiming ***“dingo biodiversity regulator”*** promoted over the people that ate them hunted them for 1000s of years in Asia or Australia or off shore islands with or without rabbits to supply a food floor while

more wildlife hunted to oblivion by these dogs. Killing well in excess of their need to eat. Vandalising vulnerable animals including quoll. Killed maimed and abandoned. Foxes pigs hunting associates of dogs eat dog kills, so who do you blame for impact?

Since the surveys of birds mammals of Gould and Gilbert 1840s, 34+ specie of mammals and sub specie have disappeared that we know of. Likely a gross under estimate. CSIROs Laurie Corbett declared the dingo “**the main culprit**” in these extinctions and reduced distribution, on going, some specie now restricted to dingo free off shore islands or pen breeding programs. 1840s to 2026. Blame agriculture for not doing a better job in quelling dogs. Cats foxes rabbit impacts given the level of ignorance obstruction lack of support from urban experts self appointed high priests in conservation matters. Theorists living on levies taxes food provided by rural communities. Those too, that on a voluntary basis have looked after the ducks possum parrots koala wallaby such the ‘blow ins’ recently discovering natural Australia can claim “**salvation**” and let the dogs go in the misapprehension that is a progressive approach! Generations of rural people black white brindle suggest a firm ‘NO’ to the tearoom theories. Not true pre1788, not true today for a lot more complications. National park tenure included as special case where dogs cats pigs rabbits foxes blackbury harbour really have no concern about lines on a map. Rural communities have collected funds skills equipment developed humane as possible control strategies including exclusion fences being sabotaged in multiple ways by zealots complacent the food outlets are always replete and affordable on their generous remuneration packages. Fences, toxins, traps, shooting, access to harbour, control strategies have been variously hijacked manipulated by disconnected academics and lobby group interests seeing a cause and funding stream to milk. All too common and not unique to dogs or pest specie generally. The definition of a pest changed even to suit agendas and political beat ups. Redirect budgets to unscrupulous canny people attracting media attention that seem incapable of even going through the motions of providing a spectrum of community perspectives to the issue.

Cat fox dog free high security pens multibillion dollar regularly patrolled steel structures are seen as requirements for many specie to survive the ravages of rabbit dog fox cat pig crow eagle drought fire Run over on tourist roads. Dog infested national parks wilderness, water catchment or farms hardly get this pen service deemed essential for inmates survival. DNA diversity or not.

In summary dingo hybrids and the few roaming domestic dogs that fossick across the landscape usually free loving hobby farm incumbents (including domesticated legalised dingo) are unacceptable of any DNA or ethnic origin. Straying domestic cats or feral released “rabbits” too are unacceptable to lizards birds native mice rats bandicoot frogs insects.... unacceptable by most established rural community

standards. Unacceptable chaos to the dog cat wildlife involved. Established ethics seen to be lapsing. Tasmania kangaroo, Rottnest. Flinders King islands (New Zealand) are some dingo free ecologies that seem to be able to survive without the imperatives of dingo 'biodiversity regulator' recently promoted over humanity in 200y or less on the Australian mainland. Yes 3500y to 1788 Aboriginal managed all the mainland for dingo populations variously successfully for wildlife survival hare wallaby bettong quoll etc. Arrival of European migrants disrupted management of fire and dogs, integration of incumbent's development of new strategies and reintroduction of mega fauna into the ecology after 50000y absence. Fire application adjusted on a needs basis. Then came the rabbit pig fox blackbury spread by the well meaning Victorian government botanist. (a chemist) Rural communities the first to recognise the invasive nature of these acclimatisation trinkets. Put them on the list of on going duties to remove creating a 'park' for skiers bushwalkers to confiscate as their exclusive bureaucrat retreat, political vote base 'selling' exclusive public access to public land to clubs promising their votes .

Sheep deer for example help with blackbury control as did strategic burning to check size of infestations then more easily grazed by sheep deer etc. Then herbicides became available as knock down if you could access infestations with spray equipment in heroic terrain.

Dogs use blackbury for harbour and nets to capture kangaroo wallaby changing the dynamics between specie well against marsupial mobility, thoroughfare and escape as do overgrown forests grassland impede visibility and escape with implications for sustainability of ecologies variously denied dog removal, big animal grazing browsing regular cool fire forest thinning disturbance.

Blackbury in destocked national park where dogs kill wallaby the native browsers that help sheep to contain blackbury as seedlings particularly. Farms dog affected that have to destock private land have to use more chemical control for blackbury infestations coming from public land via birds foxes water. Without income from sheep cattle raising then the cost of this option inhibitory. Goats deer sheep wallaby are all blackbury controllers that are destroyed eaten chased away disrupted behaviour by dogs.

Blackbury change the behaviour of fire where blackbury infest wet gullies streams destroy otherwise fire safe havens for plants and animals. Blackbury highly flammable become wicks for damaging uphill burns in bushfire events. Scour out gully soils causing erosion in dog country. Hardly the outcome water engineers envisaged for low treatment demand city sale water. Easy pest control in the wilderness thing. Land managers could not warn them as dingo adopted as no graze weapon in national park water catchment areas. Farm forestry plantation interfaces. Water engineers bringing in John Muirs wilderness water catchment theories from

the Americas. Failure there and here. The recent LA fire one case in point. Fire fighters warning many Australia cities are sitting ducks for a similar outcome. 1000s of houses burnt, damaged, variously uninhabitable indefinitely. Grazing forest activities vilified as fire control strategies where dingo coyote wolf mountain lions are embraced to inhibit the use of grazing as a management tool. Timber locked up saved and burnt. Deer vilified and shot to feed dogs. As blackberry infestations takeover ferns bogs sedges shade loving ecologies are smothered before inferno one drought summer in destocked dog country. Gone frog fish havens in the creeping infestations blocking out the sun and water flows. Erosion inundating pools and gullies once supportive habitat. Sediment soot heading for the nearest reservoir. Water quality dream compromised at the public's expense.

Blackberry climb pine plantations and timber in native forest forming an horrific fire hazard, flammable connection from volatile dead ground cover to canopy in trees crammed 2000+/- hectare, (fire safe water sharing forests typically 200 or less trees to the hectare fire damaged regrowth can exceed 7000 stems per hectare plus scrub monoculture decades of dead back leaves fallen accumulative refuse, inferno generating lethal clutter condoned by soil conservation theorists wanting to boost fog drip and have 10+ tonne per hectare dead ground cover for water quality dead tannin rich soup for black water fish kills, poisoned water and soil, with flammable scrub monoculture over lay fire ladder to canopy) generating a dog infested habitat despot hostile for birds lizards soil biota..... Dog infestations further complicate land management options where forest uses dogs to destroy wallaby possum that might nibble commercial tree seedlings.

Blackberry also obliterate access to gullies and so on. Deer sheep goats self propelled all terrain weed fire controllers and facilitate access and habitat viability for wallaby bandicoot etc. Compatible grazers not competitive and dog affected. Farmers as neighbours wait for the avalanche of dogs, weeds, fire to come at them compromised for supporting grazers to help deal with retaining habitat, water quality, tourist amenity..... secure biodiversity of plants animals rather than invasives only gaining monopoly.

In the 2019 -2020 inferno it was reported fire severity and behaviour did not differ between tenure, private, forest or park however regulation and dog country over laps such management varies little now between tenures. Neighbours of public land can't graze, cool burn, clear, thin vegetation as they wish to defend their land. It is no surprise dog affected no graze, no cool burn, no selective log operations performed similarly in the inferno creating its own momentum in 2019-2020. Fire fighting authorities using panic bulldozing of private land fences tree lots as the control lines as forest park declared "protected" land. One effective fire grazing vegetation management history to zero, Cook Town to Adelaide. Including Blue Gum carbon

forests, pine plantation thickets, over grown native tree plantations confiscated on the point of harvest for park extensions. Timber industry closed down, equipment, fire tower staff, skilled highly motivated workforce scorned disempowered and dispersed from the fire fighting rapid response effort, maintenance of fire access tracks, dog control, cool burning clearing strategic advantage zones. Once feeding koala in fire, dog safe well watered circumstances. Local community fire brigades regulated into the cities stripped of cool fire dog control grazing selective thinning options or policy input by belligerent experts confident rural minorities '*exploit and persecute wilderness*' that needs salvation preservation. No human ecoservices, obligations exist where dingo is the key biodiversity regulator in antisocial John Muir's mind and that of his recruits and following. Weir do self harm aspirations?

It should be kept in mind historically Australia's south denuded by rabbits and still in recovery. A matter of near history that seems to have fallen off the history of Australia when "over grazing abuse" enters the conversation. Cross dog fence photos are used to illustrate some false narrative and out of context for the 30+% of recent migrants to Australia keen to understand the "outback." The demon sheep and farm practices destroying biodiversity. Imported seed destroying native ecologies. Rabbits so denuded the soil such grass legume crop tree seed had to be imported to restabilise soil in the face of dust storms and sheet gully erosion. Rabbit drought. Retain water quality rebuild soil burnt variously since Australia's mega fauna ecoservices lost 50000y ago. The recovery by introduction of sheep cattle horses goats deer water buffalo donkey camel etc. complementary not entirely competitive with kangaroo wallaby wombat native mega fauna remnants surviving best before dingo arrived. (mega fauna defined 45+kg body weight) Dingo a recent complication 3500y in a 34My megafauna return after dinosaur loss 210M-65My and mammal like reptile before that 290My -245My) likely dingo more powerful predation than tiger devil quoll lion hierarchy to 50000y lion died out tiger devil quoll variously died out on the mainland when the dingo arrived and went feral variously to fully, in effect, recently employed as water catchment no graze tool. During rabbit plague 1860-1970+ vegetation, soils variously missing big migratory mobs ecoservices for soil building, seed fungi spore biota translocation, stream ecology maintenance, flood plain fire safe, free of leaf litter tramped eaten cool burnt detoxified as a hedge against such as black water fish kill events, high country or inland. Unlimited dogs now with their hunting mates of rabbits foxes cats pigs all high reproduction rates are a powerful '*combined interactive predation pressure*' as unsupported by rank stagnated fire suppressed blackberry infested areas now called national parks. More funding and effort sunk into look outs, board walks, glossy brochures than serious land management for ecological good. Fire rehab all about replacing the commercial tourist gadgets. Visitors centres, look outs, board walks Nothing similar to conservation water catchment entities lessees achieved under

challenging circumstances of resources war, plague, management method integration. Mixed specie grazing browsing now denied big animal activities again on ethnic philosophical grounds. Denied thinning, cool regular fire in grazed shaped vegetation. The dingo circumstances changed dramatically since before 1788 or beyond when dogs first began arriving. About 100+y to colonise the mainland. Dingo and wildlife changed roles from ration animals variously.

1b) the legislative regulatory policies in and around national parks state forest crown lands no mans land is far from perfect in that it is always subject to manipulation interpretation excuses of lack of resourcing policing when in fact it is due to lack of commitment or respect of neighbours needs for example.

Neighbours abused regularly as the unpaid workforce for dingo containment to public land the cheap pest controller chasing homeless kangaroo wallaby onto farms to paint farmers the cruel over grazers engineered into culling public lands spare wildlife if not eaten by the dogs or burnt with dog fences. No insight into conservation delivery, for fire risk, supportive habitat which includes removal of dogs cats foxes pigs weeds like blackbury serrated tussock monocultures of scrub and eucalypt supportive of very little other than inferno. When nice well managed, grazing forest leases are confiscated for their conservation values, water achievements, commercial tourist worth, policies of returning dingo in the futile thought they will be the lazy mans control of the rabbits foxes cats pigs and the blackbury serrated tussock disappear under the piles of toxic undisturbed eucalypt leaves as utopia returns in dog country.

As a water source, conservation entity, pleasant tourist destination most national parks turn into ecological despots within a few years of the so called exploitive grazers foresters being removed. Adding dogs hastens the demise directly regionally as native grazers are lost butchered or chased away. Follow the sheep cattle horses that maintained viable habitat. Refreshed structured vegetation. Nutrient cycle.

Rabbits foxes cats pigs blackbury rank tussock, scrub tree monocultures dominate into blanket chaos. **Any wildlife wildflowers that can, leave.** What used to be schedule 2 designated dingo habitat control free zone in the RLPB Act for park and State Forest was a dead loss literally eaten out vacated within 5-10 years or less. Indicative of unsustainable management. Animals eaten chased away intimidated to live within metres of the best shelter available began to starve in rank vegetation, no insects, starved or burnt, eaten by European wasps, no effective water cycle, nutrient cycle etc. localised general ecological collapse as dog country embedded. No cool burn, no graze policies established mass extinction before the last chapter

of uncontrollable drought summer inferno. Dysfunctional regrowth cycles establish over vast areas of the thing called park after repeated hot, large area fire the greatest threatening process for dogs foxes cats pigs water wildlife Australia is the inferno lethal to forests and all that lives in them all the water once cycled, lost to Australia in progress at the moment. The 2019-2020 inferno just the beginning of the **trip to no return** and the preoccupation of spreading killer dogs across all Australia a key driver in mass extinction, desertification, loss of seed soil ecological collapse. We in Australia are declared the front runners in species extinction so why would you ply one of the key threatening processes within the sabotaged control zones ie. Existing dog rabbit fences.

There appears to be no reasoning with unreasonable people. The evidence is everywhere. Locally internationally in wolf and other introduction experiments even more natural than the dingo plonked in Australia to become the unchallenged biodiversity regulator in fire suppressed fire interdependent vegetation also denied the megafauna it coevolved with. Denied the compensating indigenous and natural fire regimes. Dingo kill wombats koala with most surviving wallaby live under siege in rock outcrops. Dingo declared key threatening process for bridge nail tail wallaby, Northern (Southern?) hairy nosed wombat. Both survived with cattle protecting them from dogs with a level of farmer dog management. Dogs in the SE have cleaned out '**common wombat**' out of many parks Kosciuszko, Namadgi, Alpine, Barrington Tops..... State forests. Koala burnt out chewed out of the Pilliga, Grafton. Dingo use road underpasses on the Pacific highway more than koala or other wildlife as dogs wait to ambush commuters. Koala wallaby a choice to be dog dinner or run over or both. People have suggested koala are stressed out and more prone to chlamydia kept up trees hungry thirsty isolated by prowling dingo. Likely various possum similarly ring tail, brushtail, Leadbetter, pygmy, greater glider, squirrel goanna other lizards treed indefinitely fatigued for dinner guests. Hardly conducive for raising a family. Yes how sustainable is Australian ecologies denied nutrient cycling by cool fire or mega fauna mixed mob grazing. All happening within the last 50000y of human habitation.

Flat earth park policy refuses to see that big animals are an imperative particularly in fire suppressed forests near urban centres. Deprivation of mechanical thinning back to open fire safe spaced water sharing biodiverse entities rather than lapsing into flammable toxic cluttered monocultures. Creeks and productive gullies either blackburied or choked with refuse. Water access problematical. The water generally dried up or bitter black lifeless ooze because of the cluttered chaos. Even dogs face starvation or leave. Frogs fish ferns bogs a thing of the past blame 'climate change' emissions dodge shifting grazing, cool fire, forestry from land management imperatives. Some things should have been given priority when dividing up the national emissions budget of 470Mt CO₂e when it is manipulated if forests are

denied cool fire grazing forest ecoservices and inevitable “accidental natural inferno” to obliterate 30+M hectares of Australia burn forests saved for conservation preservation are justified as a “natural fire” unnatural fuel denied wildlife ecoservices, fire suppressed, among other manipulations including man made destocked dehabited wilderness thing OK to blow off the nations excess emissions in horror fires such as 2019-2020. Billions of tonnes of top soil vaporised wildlife taken for salvation protection. Forests lethally incinerated.

<https://themountainjournal.com/2021/01/27/dead-forests-making-bushfires-worse/>

<https://themountainjournal.com/2021/02/14/ghost-forests-of-the-high-country/>

1b) Legislative regulation policies adopted in parked land is largely flawed, out of touch with wildlife dynamics in or around the designated area. Rural communities largely have failed to communicate the imperatives of managing dog country for either water security food security and particularly biodiversity as our families have recovered the wildlife and habitat from the 1820-30s where dog removal has been an essential element. Dogs thinned out significantly to survivable 1880-1930s showing the most progress as mega fauna mixed grazing, rabbit removal took effect. Scrub suppressed after rabbit perturbations disrupted grasses wildflower abundance, top soil seed reserves variously lost.

Since Kosciuszko confiscated variously 1944-1969+, Mt Buffalo 1920s, Bogong 2005, boffin built bonfires ravaged dog country since the 1960-70 most conservation achievements 1820-1970 have been starved butchered burnt. Aboriginal people were seriously affected by small pox, flu STDs 1800s and as a consequence their management of fire and dogs compromised by the time the Blue Mountains crossed in 1813. By the 1820s wildlife decimated by dogs. People were unsafe as were livestock. Many accidents proved deadly as dogs found injured people before searchers. In recent times these circumstances have returned in certain areas of the mountains were rural people, remote workers, fishermen, children off camping have had near misses. Wild dogs harassing people horses domestic dogs is not unheard of Kempsey N NSW, Hunter valley have experience extreme dog populations as have South Coast NSW in the last 20y that I have been aware of as director of Rural Lands Protection Board for a number of years.

To have these accusations of people needlessly “**persecuting**” wild dogs is another blatant misrepresentation of the facts given the amount of volunteer time donated

over decades trying to deliver responsible land management in every aspect to deliver to the nation conservation achievement, secure water, food, clothing, housing, employment, export earning and domestic supply. Such emotive untruths do not lend themselves to cooperation and optimal outcomes.

Water engineers manipulating the naturalisation of the Asian dingo weaponizing no grazing policies for imaginary good for the environment (penny pinch on water treatment demands for sale water) parks bureaucrats, academics, media bushwalking clubs, international biodiversity conservation entities, lobbied by who knows what information and beat up. Dingoes encouraged unfettered onslaught of the wildlife across mainland Australia. Undermining of sheep goats cattle horse raising donkey camel water buffalo deer vilified as having no place in multicultural Australia because the **shape of their feet!!!** Sly '**discrimination by association**' as is the proliferation of uncontained packs of savage dogs. Soon we will legislate for people with swimming pools to accommodate and feed crocodiles and sharks, gratis. People vilify and persecute these animals wrongfully. Tiger snakes should be welcomed in child care centres and aged homes on the grounds of equity.

While focused on dog welfare as they prowl around the landscape dictating terms to people, wild and domestic animals, the cruelty condoned as "**natural**" is unacceptable to procure elite access to public land, farm land forests by the self service. Animals ripped to pieces, mauled left to die from blood poisoning, orphaned, traumatised chased away starved harassed off water and feed. Chronic acute harassment disruption is unacceptable cruelty and loss. Farmers have a full book trying to raise happy animals for the food supply chain while using those animals to deliver water quality vegetation biodiversity weed control fire risk mitigation regenerate soils..... There is more to farming forestry fishing fire fighting than sitting on the veranda counting your savings.

1c) ecological worth of dingo in national park or elsewhere. As stated for Tasmania Kangaroo Rottnest King Flinders islands dingo free seem to get on splendidly. Wildlife ecology thrives. Tasmania has rabbits domestic dogs devils used to have tigers until infected with toxoplasmosis. Devils a brush with facial cancer. Eastern quoll among other specie dingo destroyed on the mainland thrive in Tasmania. Eastern quoll translocated back to Mulligans Flat petting pen near Canberra thriving penned free of dogs foxes cats kangaroo. Bennet wallaby among other specie thrive in dingo fox free Tasmania and likely more important than dingo to the ecology and park attraction in Tasmania.

Schedule 2 lands NSW in park and state forest a total failure as dogs ate them bare within a few years to ecological collapse. Wildlife gone vegetation stagnant monoculture of scrub and rank tussock. Water yield observed to disappear. Bogs dried up, streams buried, frogs insect birds lizards disappeared with wombat holes empty and mossed up. No wallaby kangaroo possum just vast complete desolation. Dogs too cleared out. Policy ecologically a failure. Thatch on bare ground was Soil Cons achievement. No live grasses, certainly no wildflowers insect frogs fish birds lizards just dead. Rabbits kept their own few lawns in rare areas. Foxes cats pigs largely perished or moved out. As stated dogs feed and breed more pigs and foxes than they kill out. Cats make their own arrangements. Dingo said as a control strategy a very **blunt instrument non target carnage** unless mass extinction is the objective. Fire suppression until the drought summer inferno obliterating the evidence of the lead in, is the ultimate termination mass extinction process after the dogs have exterminated the kangaroo wallaby echidna possum wombat bandicoot quoll every other thing that moves and shakes as a few rabbit warrens are self sustaining lawns with the remnant dog fox or cat hanging in to the final extinction of wallaby kangaroo broadtooth rat.... What a policy failure not dissimilar to international experience attracting attention of rewilders and rethink of mega fauna imperatives. Different specie same process time line only comparatively, dingo is far more powerful and speeds up the decline significantly. Dingo exotic canid to Australia not just the tatters of wolf bison big horn sheep prong horn deer and so on of North America. There too the ecological significance of the pre Columbian Indian wolf, bison, big horn, cool fire regimes Sequoia security glossed over by such as John Muir and his Sierra Club apologising for Muirs appalling white supremacist attitudes and vile tirades as a hard hoof hater of sheep considering sheep horses donkey are variously native evolving in north America or migrants 750000+y before Muir arrived with his theorising.

Basically those with a fetish for dingo should build a robust steel pen lock up the dingo and let native wildlife of greater antiquity run Australia. Feed penned dingo road kill if the thing called wilderness banished to Antarctica as a fascination for those inclined. Anti social dreamers can talk to the penguin and fur seals. One wonders how many specie in SE Asia have disappeared since the dingo arrived. Some villages are reported to raise 2000-4000 dingo on rice and scraps, to eat a year with honey soy stir fried with more rice. Fishing boats fed dingo spare fish shellfish scraps, dogs gifted to Aboriginal for rations over the last 3500-4000 years as fishing boat visits became more routine. Some gifted dogs going feral and competing with people for goanna eggs of turtle crocodile emu, with wombat possum hare wallaby bilby bettong mice rats antechinus dingo helped with the hunt but were competitors either as camp dogs or free living ferals providing milk fed pups hot dogs for the camp. Pups raised by the women for hunting dogs until puberty usually

when dingo renowned to change personality more of a foe than friend. Dogs were routinely injured to reduce mobility and independence but still capable of locating small game. It is difficult to determine the frequency of disease carrying worms hydatids, hook worm etc. transmissible to people and wildlife. Swamp wallaby for example have died out in many areas due to hydatids cycle in dingo and infected wallaby less able to escape dingo with compromised lung capacity liver infection etc. Dingo vectors for many other infections including rabies if it came to Australia a disaster for people dogs and who knows what other specie.

European dogs welcomed by Aboriginal as they proved more biddable as companion and hunting dogs. Dingo never trustworthy with children or camp food. European wolf dogs selected for domestication for 40000y or more and some researchers in the field suggesting dingo is never close to the definition of “domestication.” Selection for trustworthy predictable behaviours. Semi quiet dogs very sly and untrustworthy, ambushing children adults around water holes and Bunyip legion declared by some to have its origin to deter children from going to the water holes alone because dingo stake out waterholes for ambush. Water denied to fatigue their quarry. People report dingo loiter around water points to massacre kangaroo cattle sheep etc. birds for practice. Unacceptable cruelty and carnage. Wanton vandalism. In blackbury infested wilderness dogs piledrive wallaby kangaroo into blackbury used as hunting nets where the carnage can be unsustainable. Cold mountain creeks lethal for exhausted marsupial. Killed for bloodlust, a kidney or just for sport. The ‘**persecution reputation**’ in the full context of dingo ecology and behaviour animal cruelty inhumanity is in fact largely misdirected at the wrong villain. Having sheep calves foals wallaby etc. known by the farm family is unacceptably traumatic. Time and again. Repeated trauma, or fear of it constantly. There is no debriefing for dog affected communities. Living in the war zone and patronising bureaucrats academic theorists barbarians devoid of any trace of empathy talking down at you ever the expert disconnect. Clearly acts of bully, harassment, abuse of public office using killer dogs as the sly intermediary.

1d) I am not fully qualified to talk about indigenous peoples cultural connection with dingo other than to reiterate that these dogs are cruel, kill in excess of the need to feed. From an ecological view point hard to justify running amuck in an environment with vulnerable wildlife, free living or domestic animals. Cruelty and inhumanity in the extreme belies their sleepy day time demeanour. Rural communities actively suppressed denied capacity to publish photographic reality of what these dogs do “**for fear of offending the public!**” rural communities isolated in their trauma grief. Australia should be beyond this barbarism by now.

The Aboriginal people I have known as empathetic stockmen horsemen would not tolerate the level of behaviour in a dog dingo are capable of much less lay the opportunity completely open. Many are concerned the race card is being used abuse to legitimise the unacceptable in this matter and many others. Dingo has put many people under siege for perhaps the 1000s of years they have been dumped here. Many fear Aboriginal are being stooged, used as a foil for the unscrupulous to incite unrest division when we do not have to run down kangaroo wallaby bludgeoned and thrown on the coals for a meal. Unpleasant as it can be we can humanely head shoot a bullock, a kangaroo, head for the food outlets where our meat is presented after humane dispatch. Food quality assurances met after significant procedural fairness. Best practice.

As farm families we have a deep respect for our companion and work dogs but draw the line at anarchy where dogs are condoned to lapse into primordial killing machines. Savage, dangerous and unhinged. Most camp Aboriginal I know have similar dog management ethics. Some '**cultural beliefs and attachments**' I and others find implausible. Perhaps conjured for an agenda undermining the credibility of those involved and the matter at hand.

1e) the impact of current government policies and programs for the management of dingoes in national parks. Firstly the notion of national park is a very new concept. Royal national park Sydney declared a place for the "genteel pursuit of bird watching" 1879. Yosemite north America declared in 1864. Memorial park for Genghis Khan about 1227 central Asian steppe. Aboriginal people respectful of different tribal lands could roam across Australia and when dingo arrived going feral roamed at will and fair game for rations. Hunted as required for food and quell their competition. I have no knowledge of dingo as totem as there was no need to preserve them as vulnerable specie like the black duck or other specie spared hunting fully or breeding season. Areas set aside as no dingo hunting areas were not necessary. (failure of schedule 2 vindicating this view, frazer island over stocking Namadgi overstocked even with regular relocating kangaroo from Canberra suburbs irrigated lawns and golf courses dingo dinner within a short drive.) National park is a concoction of convenience manipulation by bureaucrats political figures scoring points for voters for various agendas. Skier given priority over other community sectors paying their taxes levies rates.... Subsidising park life not allowed grazing forest activities for self support either ecologically or economically. Breed dogs up on wildlife to deliberately spill across farms forests public and private lands to bring about chaos loss and pretend the dingo did it! like lions in the Roman and Greek colosseum to feed on Christians or empire prisoners as a crowd spectacle entertainment before football was developed. Tone down the barbarism.

Want to see public land filled with dingo as a destructive force, threat, power play by the unscrupulous having no sincerity about nature conservation with rural community conservation achievement Aboriginal or European as a mere ploy to confiscate land and water to abandon to inevitably incinerate by chronic neglect negligence incompetence after decades of decline misery gone to the dogs mulched in squalor eead ground cover, for decades languishing waiting for the dry lightening storm to ignite the rubbish pile for a vast area uncontrollable holocaust burning the soil seed boiling trees in their own sap. Lock up for decades essentially unifying fire grazing histories to zero over millions of contiguous hectares and the academics political figures vacating the area leaving others to face the consequences loss depreciation.

Blowing away everything our families toiled for, went to war to protect, lost loved ones so needlessly, the sorrow of penal servitude and Aboriginal dispossession all squandered by largely post war (1945+) arrival of academic mumbo jumbo, idealist out of touch fanaticism. Legal spin, posh people at ski resorts on mind deforming substances coming up with implausible narratives to try and justify the unjustifiable in their dehabited destocked imaginary thing called national park. A little illegitimate world built around themselves and their wilderness manipulations, interpretations.

Dingoes, helicopters, mountain bikes, imported egg beaters 4WDs in their thing called wilderness. Man made concoction. Either over grown chaos or incinerated sticks as far as the eye can see. Not a bird not a leaf to hear or see. Insect gone, lizards frogs.... A very sad needless chapter in what was a place of pride nursed through colonial ignorance, world wars, rabbit plague, over stocked dingo impact. To say we are appalled, in grief, traumatised an understatement. People manipulating their world to feed whats left to packs of dogs until full exhaustion is unconscionable. Ignore the overwhelming evidence dingo bingo is unsustainable for biodiversity, water, amenity. None of the intended purposes delivered long term. Mere political rhetoric vote catching gimmick selling public land access to an elite constituent. Nothing to do with global climate change. Man made climate change locally, by neglecting land management to fire safe vegetation, not city carbon tax dodge or other “good idea” dreamed up in a university tearoom with a cannabis smoking ceremony or the like. Wilderness weed for the wallaby. Unacceptable.

1f) while I and others I know respect genuine Aboriginal beliefs and customs increasingly Aboriginality is being imposed disingenuously agenda driven blatant manipulation which may or may not be legitimate. I and others fear well meaning **Aboriginal will be used as a foil** by the unscrupulous to try and legitimise the unjustifiable. Even dodge accountability for adopting bad advice on policy, neglect negligence ignorance abdication of responsibility justifying abandonment in

wilderness. Conservation values gone to the dogs or incinerated wilderness. As long term empathisers of Aboriginal people we are not sympathetic with any race, religion, gender, used abused to complicate land water management dog management taken out of context historically or for present day circumstances where wilderness for example tries to dignify justify neglect and abdication from human ecoservice obligations for example where humanity implicated in the extinction of giant wombat kangaroo wallaby birds goanna dryland crocodile lions etc. eggs joey adults eaten dispossessed variously since human arrival. Human fire then compensating as a mega fauna replacement until 1788 reintroduced big animal services options with forestry thinning from the 1920s more formally. Traditional fire regimes dog removal integrated with big mob grazing and or forest selective thinning to maintain the fire safe water sharing vegetation. Biodiverse supportive habitat.

Post mega fauna fire regimes in the vegetation coevolving with big grazer browser ecoservices then disappearing allowing over growth clutter loss of fire safe water sharing spacing biodiversity given away to aggressive monocultures often more fire hardy. Charles Darwin talked about this in the 1860s. Vulnerable specie lost starved butchered burnt in the monoculture that emerges with destocking no disturbance. Then came the dog to do over the small fauna doing the seed spore dispersal soil building such as wallaby possum bandicoot bettong potoroo..... Most welcoming seeking the activity company of sheep cattle horses donkey camel..... Deer goats and so on when they received assisted passage from the northern hemisphere losing less mega fauna and some preserved by domestication.

Biodiversity generally does not fuss about ethnic background discrimination by foot dimension but prefers process and outcome. Plants move by employing animal mobility. Animals move and enhance seed germination accumulate proliferate soil biota nutrient processed creating regenerative sites cultivated prepared for seed spore to succeed. Dogs may facilitate or obstruct this essential process. Making national park relevant for conservation, water or amenity not just a dingo dominated zoo. Arguably national park declaration complicates landscape management continuity. Wilderness more so.

1g) other matters. I with the help of our elders time and input revisited dog management across the alps as after the declaration of Kosciuszko Namadgi Alpine parks 1969+ wild dogs made a mysterious reappearance. Once the 8650km dog rabbit fence built in 1914 where southern SA, Victoria NSW ACT south central Qld until political forces reduced the Qld fence by 3000km 1981 sheep wildlife massacred until a recent push to install 9000km of cluster fence Qld (4500km flood damaged 2025 impacting hairy nosed wombat and bridle nail tail wallaby recovery

among other dog affected specie all but exhausted) Farming communities losing income cattle sheep goats infrastructure fencing access to dog control and so on in Qld. People have few clues of the need to have dog free conditions to supply food clothing water soil repair. Dogs difficult too remove after breaches of fences with flood, fire, drifting sand, fallen trees. To breed dogs deliberately mischievously within these containment management fences bureaucratic fiddling with access too funds, poisons skilled workforce, arial baiting foxes dogs cats pigs rabbits plague locusts has impacts eventually in town for food clothing prices, employment, domestic and export trade. Public money diverted from roads schools hospitals to rescuing endangered specie all for the sake of timely dog management vegetation management across affected tenures. Parks forest crown reserves lease freehold mine sites.....

While dingo supporters may idealise the prevention of what they perceive or told is cruel “**persecution**” of dingo, need like us all to consider the larger picture of what we want Australia to be. What are the landscape issues of animal welfare public safety. Afford to be. Some of us have done the science and sociological studies on dingo. The Chamberlain family a recent tragedy, a number of families visiting Frazer island paying a toll for the ideologies of others. People variously in denial. Idealise the caveman utopia of the past. Life expectancy of perhaps 30y old.

Wildlife disappearing from the surveys 1830-40s of Gould and Gilbert. Avoid dog control and up come the multi\$M steel pens around mice rats bettong quoll hare wallaby. Get rid of the Kimberley donkey and what happens to the wildlife and vegetation, lake Gregory Brumby, cattle off lake Argyle, water buffalo camel off Kakadu central Australia. Who feeds the ducks pelican swans fish frogs denied nutrient cycle. Dingo wandering through the Macquarie marshes with their pig fox companions ripping up moulting swans ducks raiding nests. Fly by surveys wondering where the water birds have gone. Eaten starved or flown away? Dingo already raiding swamps, beach birds on the coast of NSW and Victoria where birds wildlife are in recovery from fire, dogs, urban sprawl, road kill.....

The **emotive accusation of persecution of the dingo** on an ecological social animal welfare platform needs to put this claim on a holistic footing and remembering that farming feeds the people not the ‘super mark ups’ and food imports will only occur to dump food (loaded with chemicals for example banned for Australian farming) surplus to others needs affordable or not traded for our iron ore bauxite coal a finite resource. Our government cannot complete a 1600km inland rail line. 1000km short of destination. How can food and goods keep distribution, production? Commuters Newcastle Sydney better voting strength for a fast passenger rail!. Good place for dingo habitat as well?

If farmers foresters fishermen have people ill informed or not undermining their capacity to retain food clothing housing water supplies beating savage dangerous dogs off with a stick then what? Biodiversity has their backs to the wall and sections of the disconnected society want to spread further the key threatening process. Howling around the ski fields living at the rubbish tips and sewer works, skiers leavings on the ski slopes. National parks are effectively dog breeding dispersal mechanisms to reinstate anarchy and loss. Fuel the endangered specie industry where otherwise unemployed university staff and students busy themselves solving problems they created confiscating 100+% of mainland Australia 25+% of GDP mined from great holes in the artesian basin, algal blooms of south Australia, deserts of Kosciuszko where the deciduous forests adorn the ski fields year round. International drawcard. Frogs are bred in shipping containers as long as people do not turn off the electricity supply. Dingo that open doors of campervans to eat the children inside do not learn to open refrigeration containers and eat the frogs or the staff providing mealy bugs. Seriously one needs to visualise sustainability and what is lost, what is gained.

Are in fact dingo unjustly '**persecuted**?' should the dog supply be put back on the dinner guest list to retain wildlife of greater antiquity and the sheep cattle goats eaten instead of the wallaby kangaroo echidna fish platypus orchid corms yam daisy the rabbits have left us. Fair for about 1M people not the 28+M of today. Dingo can raise 8-10 pups a year max in optimal habitat. Koala wallaby goanna. In about 3 years 200 dogs to feed or disperse. 100000 ha of Namadgi park unless 300 dogs get regular truck loads of kangaroo from Canberra suburbs 300 dogs breed 1500 pups first year, second year 9000 pups and so on. Breed to capacity to raise food. Wallaby breeding surrogacy program will have difficulty in keeping up with dingo demands and road kill fatalities, frog breed, loss of insects to megafires. General ecological collapse. Soil seed loss fundamental to recovery. We are still recovering from the now forgotten rabbit plague vegetation loss wildlife loss and a bit further back the loss of 88% of our megafauna 63+ specie of 532, 50000y ago. International ecologists are just coming to terms what 93% of global mega fauna loss in the last 50000y has meant as people look to purge mindlessly modern Australias replacement mega fauna because their **feet don't fit ethnic scrutiny** as judged by multicultural Australia, camel, donkey, horses, cattle, sheep, goats, deer, water buffalo..... feed the kangaroo wallaby wombat to ever increasing dog populations and distribution. Ironically many lost mega fauna giant kangaroo wallaby birds were referred to have had hooves adapted to long distance travel over hard ground through grasslands scrub lands forest..... Evolution selection not unsurprising for the same solution irrespective of ethnic bias, overlays.

Regenerative farming cannot advance with no till, biodiverse cropping alone, without big animal impact. Soil production restore water infiltration aggregation fertility

nutrient cycle. This the system in place for 290+M years. No big animals no plant adaptation to dry fire prone land Australia or any where. Plant nutrition germination distribution cannot function without big animal impact, imperatives. Dogs and people put in a hard place without it. Decision time to be wreckers or builders. Park forest farm fishery it matters little.

200 dogs on Frazer island 170000 hectares is unsustainable. Dogs die young from eating sand with their turtles goanna fish birds tourists fish bait. Eating plastic tents tourist bathers shoes. 100000 hectare Namadgi 300 dogs will have to disperse onto near by farms to eat wildlife sheep cattle horses people harboured on farms from dog trespass. Dogs head off to near by parks head to Brisbane Melbourne Adelaide. North coast koala sanctuaries not yet burnt despots. Vibrant forests once grazed cool burnt selectively logged vibrant habitat now saved for carbon off set. '**Cap and trade**' scheme Kevin Rudd was told was flawed but ignored anyway as did Bob Carr and others into selling carbon pilfering from agriculture and forestry. What cost zero emissions? Snowy 2 digging through aquifers with gay abandon for cheap electricity \$42+B more power lines, windmills, pushbike rail trails.

There were once an estimated 100000 koala in the Pilliga forest bred up kept fed and fire safe by foresters since the 1870s. Dogs excluded from the 1950s Koala thrived chlamydia free fed regularly logged regen fresh forest until the forest parked in 2005, the forest canopy burnt 2006 and dogs mysteriously reappeared to chew any survivors. Next door Warrumbungles incinerated 2013 locked up parked 1953. No water in the fire truck cooked the rock climbers smoke free vista, ANU space observatory. Dogs recently read the gazette and began arriving mysteriously. Did the Sydney bushwalking club know about this. The Oberon dog compound. Same dogs ending up on confiscated sheep raising areas of the Warragamba catchment. Safe for sheep one moment and radio tracked dogs monitored chewing through the wildlife recovery taken for "**salvation.**" Who drove the canvas covered utes full of dogs sprinkled around the new national park acquisitions? Same ones driving the rare wallaby perhaps to challenge biosecurity procedures. New park acquisitions over laying wallaby, greater glider, koala finds variously.

The Australian public need to know their food water biodiversity conservation is being undermined by people inciting Aboriginal people among other sectors to breakdown dog management within the dog fences geared to protect the interests of populous Australia SE and WA. Their food water timber housing railways bridges power poles paper.....biodiversity security amenity. Hijacking of GDP to restore biodiversity going to the dogs starving in stagnation or burning in locked fire suppressed vegetation said taken for salvation.

The academic theories that dogs restore some mysterious ecological utopia have little substance.

Dingo are not target specific lazy man controllers of rabbits foxes cats pigs in parks forest or other lands at any acceptable cost to other more valued biodiversity. Dog infested water catchment where naturalisation of the dingo all began has proved very costly disaster. Ecological catastrophe to match or exceed rabbit plague. Inferno kills forests erodes soil mass extinction events are followed by floods (Lismore, Sydney, and or deepening drought cycles where local water not recycled by the lack of live forests. If cyclone rains reach southern Australia then water may persist if live forests provide snowflake nuclei and top up moisture. If not the hydration of the land runs down until the next cyclone gully rush.

Man made climate change where 1990 emissions capped at 470Mt CO₂e are shared by expanding demands for electricity, transport housing (17M=>28M people 1990 2025) at the expense of grazing forestry cool fire all at the expense of land management. Water for cities sucked off burnt, dog country.

Since 1998 Victoria lost its Mt Plum pine (evolved up to 285Mya) Snow gum evolved up to 34Mya with Alpine Ash Mt Ash facing extinction one major fire away. Salvation, climate change looks a pretty hollow promise. ACT admit they have largely lost their snow gum Plum pine and majority of Alpine ash as well by fires 2003 and 2020. Once proud dog habitat. NSW audits look not so good either with a gum beetle ring barking surviving snow gum because someone killed all the birds 2003, 2006, 2020. Tree loss having dramatic implications for water yield for the Murray Tumut Murrumbidgee Snowy river systems. Well didn't the vilified dispossessed snowy stockmen repeatedly warn of such a catastrophe. Dismissed as uneducated unscientific unqualified opinion, vested interest. (correct stockmen nurtured Snowy through colonial ignorance rabbit plague war famine poverty why should they not have a vested interest?) why denied educated opinion and insight?

<https://www.abc.net.au/news/2021-03-10/sudden-death-of-snow-gums-longicorn-beetle/13226128>

<https://australian.museum/aap/snow-gum-dieback-raises-fears-for-largest-river-system/>

If Aboriginal are now put in to rescue the manic ski sect, soil con experts from town or London no one could reason with because they were the educated experts. Public paid positions of privilege and trust! Even the 1000+ Australian academy of science fellows (1954-2025) endorsing no graze no burn no forestry policies most being astronomers, nuclear physicists, immunologists etc. may be one or two agriculture

or allied subjects. Dairying or bee keeping, bog boffins hard hoof haters recruits zero evidence in matters of range management or fire fighting. Academy of science just another opinion lobbied by who know how much misinformation to curry credibility into stupidity. Science the so called ***unbiased adjudicator*** has brought doubt on the scientific process there as well. Are our Aboriginal community being stooged into the same folly? As long time observers we hope not.
